We want to hear from you. Send any comments regarding this document to support@metalogix.com.

The level of technical support provided depends upon the support package that you have purchased. Contact us to discuss your support requirements.

Email Migrator Version 4.7.1 Release Highlights

New Feature	Why It Is Important
Distributed Migration with PowerShell	One of the recommendations to obtain higher throughput of migration is configuring multiple Email Migrator consoles on multiple machines to execute migrations in a concurrent manner. The new distributed Migration feature helps to alleviate the manual efforts necessary to configure and manage multiple installs of Email Migrator and perform multiple migrations. This feature allows a user to identify a base machine (controller) that remotely and silently install Email Migrator on a set of other machines (agents) that are all linked together in the backend. All jobs built on the Controller will be queued up and distributed out to the Agents as they become available. Distributed PowerShell Migrations has been tested and is supported.
Windows Server 2016 and SQL Server 2016 Support	SQL 2016 has been tested with Email Migrator 4.7.1 compatibility. Windows Server 2016 has been tested and is supported.
